40-45 Min Speaker Script (Based on v1.1, 27 slides)

Target total: ~42 minutes (plus 3 minutes buffer)

1. **Slide 1 (1.0 min) - Title**

"Today I'll walk through how Edge AI compute is shifting from smartphones to smart glasses, and what that means for SoC competition and foundry strategy. The core question is not whether AI moves to the edge, but which form factor captures the next wave of value creation."

2. **Slide 2 (1.5 min) - Agenda**

"We'll cover four parts. First, what Edge AI is and why now. Second, the smartphone Edge AI outlook and where value is concentrated. Third, whether smart glasses can become the next mass platform. And fourth, the competitive implications across ecosystems and silicon vendors."

3. **Slide 3 (2.0 min) - Edge AI definition**

"Edge AI means running inference locally for immediate, context-aware decisions, while still using the cloud for heavy compute and model-scale tasks. The local layer improves latency, privacy, and bandwidth efficiency. So this is not edge versus cloud; it is workload partitioning by latency and compute intensity."

4. **Slide 4 (2.0 min) - Screen to perception shift**

"We are moving from screen-centric interaction to perception-centric, always-on assistance. That shifts silicon requirements toward lower-power AI-centric compute under stricter thermal limits, especially in wearables. In short, form factor evolution and SoC architecture evolution are now tightly coupled."

5. **Slide 5 (0.8 min) - Chapter I divider**

"Before discussing the next form factor, we need to anchor on where Edge AI value is generated today: smartphones. This chapter quantifies current demand, monetization, and SoC positioning."

SAMSUNG
Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34
Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

6. **Slide 6 (2.0 min) - Smartphone TAM reality**

“Smartphone units have been soft since 2021 despite 5G. GenAI helps, but near-term upside is constrained by cost structure and premium concentration. So growth exists, but it is narrower and less broad-based than early AI-phone narratives suggested.”

7. **Slide 7 (1.8 min) - Premium concentration**

“Premium is the revenue engine. It is a minority of units but majority of value, so OEM strategy naturally tilts toward premium AI differentiation. That also means technology adoption and feature velocity are increasingly concentrated at the high end.”

8. **Slide 8 (2.0 min) - Memory inflation impact**

“Rising memory cost creates a two-speed market. Premium can absorb it and continue AI feature expansion; mid/low tiers cannot, so they optimize BOM and delay richer AI capabilities. This single cost variable explains much of the segmentation we see in roadmap decisions.”

SAMSUNG

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34

9. **Slide 9 (1.8 min) - Premium SoC AI differentiation**

“In premium tiers, SoC vendors compete on AI experience, not just benchmark scores. Differentiation comes from ecosystem integration, always-on context handling, and faster feature rollout. Premium AI is becoming a systems-level competition.”

10. **Slide 10 (1.6 min) - Advanced packaging in premium**

“At the performance frontier, packaging matters as much as node. Thermal efficiency, interconnect, and system-level optimization are now central to delivering premium AI workloads within mobile constraints.”

11. **Slide 11 (1.5 min) - Mid/low node strategy**

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

“In mid/low tiers, ASP constraints force vendors to extend lagging nodes and adopt cost-optimized variants. This is rational economics: protect margins first, then stage AI capabilities over time.”

12. **Slide 12 (1.5 min) - Memory capacity trade-off**

“Capacity de-spec in mid/low devices is a direct response to memory pricing pressure. The consequence is slower on-device AI capability expansion outside premium tiers.”

13. **Slide 13 (1.8 min) - AP SoC unit outlook**

“Unit growth is modest, with temporary pressure from memory supply tightness. Vendor roles are differentiated: some lead in volume, others in premium value capture. This is a mature market with selective upside.”

14. **Slide 14 (1.8 min) - Premium battleground**

“Share shifts in premium are driven by AI innovation cadence and price-performance positioning. The key point is that even with competitive reshuffling, smartphone upside is still bounded by market maturity and cost structure.”

SAMSUNG

Shibin XieS&M - Foundry MI/MP/BS/BD - MI2026-02-27 15:14:34

15. **Slide 15 (1.0 min) - Chapter II divider**

“As premium-share gains mature and smartphone upside stays constrained, growth leadership shifts to AI-native form factors, led by smart glasses. Now we test whether this category can truly scale.”

16. **Slide 16 (1.3 min) - VR/AR/XR taxonomy**

“This slide clarifies definitions and where smart glasses sit relative to headsets. So what: as devices move toward glasses-like form factors, friction drops and daily utility rises, which expands the market beyond niche use cases.”

17. **Slide 17 (2.0 min) - Why smart glasses can be mass UI**

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

“Smart glasses combine natural interaction, ambient AI, and better wearability than traditional XR headsets. As miniaturization improves and AI utility increases, the use case shifts from occasional entertainment to daily assistance.”

18. **Slide 18 (2.0 min) - Smart glasses vs XR market split**

“Forecasts show smart glasses taking the majority share of combined XR/glasses units by 2029. The base case is still conservative relative to total eyewear penetration, so upside remains significant if product-market fit accelerates.”

19. **Slide 19 (1.8 min) - Practical AI features**

“Capability evolution is clear: voice first, then multimodal camera-based context, then AR-guided interactions. Each generation improves utility and narrows the gap between novelty and habit.”

20. **Slide 20 (1.8 min) - BOM advantage**

“Cost structure is a major unlock. Smart glasses can avoid some expensive XR components, enabling more consumer-acceptable pricing. Lower BOM supports broader distribution and faster adoption cycles.”

SAMSUNG
Shibin XieS&M - Foundry MI/MP/BS/BD - MI2026-02-27 15:14:34

21. **Slide 21 (1.8 min) - SoC innovation unlock**

“Next-gen SoCs shrink die size, improve efficiency, and enable more on-device intelligence. That reduces phone tethering and supports all-day wearable behavior, which is critical for mainstream adoption.”

22. **Slide 22 (2.0 min) - Path to mass adoption**

“Adoption depends on converging three things: price, comfort, and battery life, alongside useful AI experiences and trust. The market is moving in that direction, but user frictions like privacy and wear comfort still need to be addressed.”

23. **Slide 23 (2.0 min) - Platform war**

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

“As adoption inflects, competition shifts from hardware specs alone to ecosystem control. Meta, Aqua, Xiaomi, and Android alliances each bring different strengths: installed base, integration depth, channel scale, or openness.”

24. **Slide 24 (2.0 min) - SoC vendor war**

“SoC share is expected to diversify over time as custom silicon strategies scale. Leadership will depend on balancing performance, power, cost, and ecosystem fit across a rapidly evolving product mix.”

25. **Slide 25 (2.0 min) - Key takeaways**

“Let me summarize. Smartphones remain the near-term anchor, but growth is constrained and value is premium-skewed. Smart glasses are emerging as the next scalable Edge AI interface, enabled by practical AI, better economics, and SoC progress. Winning will require synchronized execution across product, ecosystem, and silicon.”

SAMSUNG

26. **Slide 26 (0.3 min) - Survey**

“Thanks for joining. Please scan the survey link if you’d like to share feedback.”

Shibin XieS&M - Foundry MI/MP/BS/BD - MI2026-02-27 15:14:34

27. **Slide 27 (0.2 min) - Thank you / close**

“Thank you. I’m happy to take questions.”

If you want, I can generate a second version as a **word-for-word teleprompter script** (long-form, ~5,000-6,000 words) with exact transitions and pause cues.

---

1. **Slide 1 - Title**

“Good [morning/afternoon], everyone. Today I’ll cover how Edge AI SoCs are powering a shift from smartphones to smart glasses. The key question is where

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

the next wave of value will be created, and which ecosystem and silicon strategies are best positioned to win."

2. **Slide 2 - Agenda**

"I'll walk through four parts. First, what Edge AI is and why now. Second, the smartphone outlook and SoC dynamics. Third, smart glasses as the next Edge AI platform. Fourth, competitive implications and key takeaways. I'll keep this practical and focused on market structure, technology requirements, and strategic positioning."

3. **Slide 3 - Edge AI Definition**

"Let's start with a clear definition. Edge AI means running AI workloads locally on the device for real-time, context-aware tasks, while the cloud handles heavier compute and model-scale workloads. This architecture improves latency, privacy, and bandwidth efficiency. So this is not edge replacing cloud; it's edge and cloud working together based on workload needs."

4. **Slide 4 - Screen-Centric to Perception-Centric**

"The interaction model is shifting from screen-centric app navigation to always-on, multimodal assistance. That shift has major silicon implications. Devices need lower-power AI-centric compute, tighter thermal control, and deeper memory-logic integration. In other words, form-factor change is forcing a compute architecture reset."

5. **Slide 5 - Chapter I Divider**

"With that foundation, let's examine smartphones, which remain today's largest Edge AI platform. Before we forecast the next form factor, we need to quantify where smartphone value is still growing and where constraints are hardening."

6. **Slide 6 - Smartphone Growth Reality**

"Smartphone units have been under pressure since 2021, and 5G alone did not trigger a major sustained upgrade cycle. GenAI introduces a new catalyst, but the benefit is uneven. Cost pressures, especially memory-related, limit broad-

SAMSUNG
Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34
Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

based uplift. So smartphone AI growth is real, but narrower than early expectations."

7. **Slide 7 - Premium Concentration**

"The premium segment is the economic core of the market. It represents a smaller unit share but a much larger revenue share, so OEM roadmaps naturally prioritize premium AI experiences. This concentration explains why most first-wave AI differentiation appears at the high end."

8. **Slide 8 - Memory Price Pressure**

"Memory inflation creates a structural split across segments. Premium devices can absorb higher memory cost and keep pushing AI capability. Mid and low tiers face tighter BOM constraints and slower feature scaling. This is one of the most important drivers of the two-speed market dynamic."

9. **Slide 9 - Premium SoC Differentiation**

"In premium smartphones, SoC competition centers on AI experience quality, not only raw benchmark performance. Vendors differentiate through system integration, always-on context handling, and faster deployment of AI features. The battleground is becoming ecosystem plus silicon, not silicon in isolation."

SAMSUNG
Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34

10. **Slide 10 - Advanced Packaging**

"At the premium frontier, packaging is a strategic enabler. Better thermal behavior, interconnect efficiency, and system-level optimization allow higher sustained AI performance. As workloads become more AI-heavy, packaging decisions increasingly affect user-visible performance."

11. **Slide 11 - Mid-Low Node Strategy**

"In mid and low tiers, ASP limitations force a different playbook. Vendors extend lagging nodes and use cost-optimized process variants to preserve economics. The objective is margin protection while selectively enabling AI features where ROI is clear."

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

12. **Slide 12 - Memory Capacity Trade-Offs**

“As memory pricing pressure persists, lower tiers often reduce memory capacity to contain BOM costs. That directly slows richer on-device AI use cases in those segments. So the cost structure is not just a margin issue; it also shapes feature availability and adoption timing.”

13. **Slide 13 - AP SoC Unit Outlook**

“Looking at unit outlook, overall smartphone AP SoC growth remains modest, with periodic softness tied to memory supply conditions. Vendor positions remain differentiated between volume leadership and premium value capture. This is a mature market with selective opportunities, not broad hypergrowth.”

14. **Slide 14 - Premium Share Battleground**

“Premium share will continue to shift based on AI innovation cadence and price-performance trade-offs. Even with competitive movement, the broader point is unchanged: smartphone upside is bounded by market maturity and cost constraints. As premium-share gains mature, we need to look beyond smartphones for the next growth engine.”

SAMSUNG
Shibin XieS&M - Foundry MI/MP/BS/BD - MI2026-02-27 15:14:34

15. **Slide 15 - Chapter II Divider**

“That brings us to smart glasses. Given constrained smartphone upside, growth leadership is likely to shift toward AI-native form factors. The question now is whether smart glasses can move from promising category to mass-market platform.”

16. **Slide 16 - VR/AR/XR Taxonomy**

“Before sizing the opportunity, let’s align definitions across VR, AR, XR, and smart glasses. This classification matters because user friction and use-case frequency differ significantly across these form factors. The key takeaway is that movement toward lighter, glasses-like devices expands daily usability and therefore market potential.”

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

17. **Slide 17 - Next Mass-Market UI**

“Smart glasses are positioned as the next mass-market interface because they can combine ambient assistance with lower interaction friction. As hardware miniaturizes and AI utility improves, the use case shifts from occasional novelty to continuous real-world support. That is the core demand-side thesis.”

18. **Slide 18 - Smart Glasses vs XR Headsets**

“The forecast indicates smart glasses capturing the majority of combined smart-glasses/XR unit growth by 2029, while headsets remain comparatively niche. Importantly, the base case assumes modest penetration relative to total eyewear usage. That leaves meaningful upside if product-market fit accelerates.”

19. **Slide 19 - Practical AI Features**

“Feature progression is straightforward. First generation: voice-first utility. Current generation: multimodal understanding via camera context. Next generation: richer AR-guided interaction. Each step raises real-world usefulness, which is what drives repeat usage and adoption durability.”

20. **Slide 20 - BOM Advantage**

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI2026-02-27 15:14:34

“Cost structure strongly favors smart glasses versus high-end XR headsets. By avoiding some expensive components and using efficient SoCs, smart glasses can reach more consumer-friendly price points. Lower BOM is not a side note; it is central to scaling beyond niche demand.”

21. **Slide 21 - SoC Innovation as Unlock**

“SoC improvements are enabling the category: smaller die, better power efficiency, and more on-device intelligence. This supports all-day use and reduces dependency on phone tethering. In practical terms, silicon is moving smart glasses from accessory behavior toward standalone utility.”

22. **Slide 22 - Path to Mass Adoption**

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

“To replace or complement conventional eyewear at scale, devices must improve on three fronts: comfort, battery life, and price, while maintaining genuinely useful AI functions. Consumer intent is strong, but barriers like privacy concerns and wearability friction remain. Adoption will depend on execution against these constraints.”

23. **Slide 23 - Platform War**

“As category adoption improves, competition shifts from device specs to platform control. Different players bring different strengths: ecosystem lock-in, channel scale, pricing aggressiveness, or open-platform developer reach. The outcome will be determined by integrated ecosystem execution, not hardware alone.”

24. **Slide 24 - SoC Share Evolution**

“SoC share is expected to diversify as more custom silicon strategies mature. Incumbent leadership remains significant, but integrated ecosystem players and cost-focused challengers can gain share. Success will depend on balancing performance, power, cost, and time-to-market.”

SAMSUNG

25. **Slide 25 - Key Takeaways**

Shibin XieS&M - Foundry MI/MP/BS/BD - MI2026-02-27 15:14:34

“Let me close with six points. Smartphones remain the near-term Edge AI anchor, but growth is constrained and value is premium-skewed. Mid/low tiers face delayed AI monetization under BOM pressure. Smart glasses are emerging as the next mass-market Edge AI form factor. Their adoption is supported by practical features, improving economics, and SoC progress. Going forward, winners will be those who execute across ecosystem, product, and silicon in sync.”

26. **Slide 26 - Survey**

“Thank you for your time. If helpful, please share feedback through the survey link so we can refine future analysis.”

27. **Slide 27 - Thank You / Q&A**

Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M - Foundry MI/MP/BS/BD - MI|2026-02-27 15:14:34Shibin Xie|S&M

“Thank you. I’m happy to take questions.”

If you want, I can generate a second script version with **shorter phrasing for non-native audiences** and **explicit pause cues** (for a tighter 40-minute delivery).
